

Hedwig's 10PM Intelligence Report

Wednesday, 09 September 2026

We need to parse the raw data, group into categories, consolidate duplicates, and produce a report following the exact structure. The user wants the report in EXACT structure as described, with sections: ## 3 Things I Absolutely Should Know Today, ## AI, ## Developer World, ## Cybersecurity, ## India, ## Learn, ## Opportunities, ## Tools Worth Trying, ## Tech Outside AI, ## My Action for Tomorrow, ## If You Only Remember 3 Things.

We must follow rules: each major item within a section formatted as:

Headline

What happened: 1-3 sentences.

Why you should care: specific to a Diploma IT student in India.

Impact: Low / Medium / High / Critical.

What to do: only include when genuinely justified.

Source: cite the source name from the data (e.g. "TechCrunch", "Reuters") -- do not fabricate.

We must write each section header (## AI, ## Cybersecurity, etc.) EXACTLY ONCE, in the order given above. NEVER repeat a header a second time, and NEVER write filler like "(covered above)" or "(no further news)" as if it were a new section.

If a section genuinely has nothing significant, write one plain sentence saying so under that section's single header -- never a second header.

Distinguish confirmed facts from company claims, opinions, or speculation when the data makes this clear.

Do not treat a single unverified item as confirmed fact -- hedge appropriately if the data only gives one weak source.

Do not recommend something solely because it appears frequently in the data.

Do not encourage collecting certificates over building projects.

Do not over-index on AI at the expense of core IT/developer fundamentals.

Write in plain, direct language. No filler, no hype words.

We need to parse the data.

First, list the categories present: AI, Developer World, Cybersecurity, India Policy (but category is "India"), Learning (but there is a "Learn" section?), Opportunities, Developer Tools (but category "Developer World" includes devops tools etc.), Hardware, Major Companies, World Tech Context.

But the required sections are: AI, Developer World, Cybersecurity, India, Learn, Opportunities, Tools Worth Trying, Tech Outside AI. Also "3 Things I Absolutely Should Know Today" at top, and "My Action

for Tomorrow" and "If You Only Remember 3 Things" at bottom.

We need to map raw data items to these sections.

Let's examine raw data groups:

=== AI ===

Multiple entries: AI Coding Assistants Release Notes, best AI coding assistants, G2 data, analytics insight, itbrew, YouTube videos about coding assistants, etc.

These are about AI coding assistants. We need to consolidate, pick the most relevant/impactful items. The rule: Prefer fewer high-value items over a large volume of news. Consolidate duplicates, don't list near-identical items separately.

We must pick 3 things for "3 Things I Absolutely Should Know Today" across all categories. Those should be the three highest-impact developments across ALL categories. Should not invent items; if only one or two truly important things, say so.

So we need to evaluate across all categories for the top three.

First, parse each category's significant items.

AI section:

Items:

- Z.AI Claude Code 2.1.266 fixes gateway regression (Sep 9, 2026). Source: Releasebot.
- "Best AI Coding Assistants as of September 2026: Antigravity is Google's next-generation AI coding assistant..." from shakudo.io blog. This mentions Antigravity replaces Gemini CLI. Built in Go, supports async background workflows.
- G2 data article about AI Coding Assistants in 2026.
- Analytics insight: 7 AI coding features changing how developers work in 2026.
- ITbrew: most popular AI coding tools right now, including Gemini Code Assist features.
- YouTube vids about AI coding assistants (maybe not needed).

Potential high-impact: Antigravity (Google's new AI coding assistant) announced at I/O 2026, replacement for Gemini CLI; could affect developers. Also CERT-In advisory about AI cyber threats (but that's cybersecurity). Also Claude Code update.

But we need to pick three across all categories. Let's list all categories and find top items.

Developer World:

Items:

- Azure Architecture Center: Automate API Deployments by Using APIOps.
- Octopus Deploy: Continuous Deployment & Delivery Software.
- GitHub list of devops tools (techiescamp/devops-tools) curated list.
- Harness blog devtools list.
- Octopus Deploy again.
- Postman: AI-native API Platform.
- Box Dev Docs.
- YouTube 40 APIs Every Developer Should Use.

Possibly the most impactful: Azure APIOps, Octopus Deploy, Postman AI-native API platform.

Cybersecurity:

Items:

- CERT-In issues urgent warning on rising AI cyber threats in India (May 6, 2026). Source: dqindia.com.
- CERT-In issues advisory against AI-driven cyber attacks for MSMEs etc (Apr 27, 2026). Moneycontrol.
- CERT-In flags high-risk security flaws in Google Chrome (Mar 10, 2026). Varindia.

These are about CERT-In advisories. Significant for Indian IT students due to relevance to patch management, security.

Also maybe other cybersecurity items? Only these.

India Policy:

Items:

- Government to back 15 space projects to solve issues like crop failure, flooding - India Today (Jun 12, 2026).
- PM launches Rs 1 Lakh Crore Research, Development and Innovation Scheme (Nov 12, 2025) - DST.
- Government approves 29 more proposals under the Electronics Component Manufacturing Scheme (ECMS) (Mar 30, 2026) - PIB.

These are policy items.

But the required section is "India". The description: "Policy, IndiaAI, MeitY, Digital India, privacy/data regulation, cybersecurity regulation, programs. For policies: explain what changed, who's affected, and whether the reader needs to act."

So we need to include relevant policy news. The data includes space projects, Rs 1 lakh crore scheme, ECMS approvals. We need to pick the most impactful for a Diploma IT student. Perhaps the ECMS approval affecting electronics manufacturing, the Rs 1 lakh crore research scheme (maybe relevant for innovation), and the space projects maybe less directly IT.

But we have to consolidate; maybe pick the ECMS approval and the Rs 1 lakh crore scheme as key.

Learn:

Items:

- YouTube: I tried 50 Programming Courses. Here are Top 5.
- Computer Science Lessons YouTube channel.
- C Programming Tutorial for Beginners.
- Various other YouTube learning resources.
- "Learn These 5 FREE AI Courses Before It's Too Late!" video.
- "Saumya Singh" video about new certification courses from Microsoft, Google & TCS 2026.
- "How I mastered C in College: Complete Roadmap + Free Courses + Book PDF!"

We need to rank each as Worth doing / Maybe / Skip, prioritize skills over certificates.

Potential high-value: The "50 Programming Courses" video might give top 5 courses; but we need to provide concrete resources. However we must not just list many; pick a few.

Opportunities:

Items:

- Top Paid Open Source Programs for Aspiring Tech Professionals (March 2024) - Google Summer of Code, etc.
- GitHub Announces Three New Programs For Developers, Students And Startups In India.
- Open Source in India 2026: Complete Student Guide - GSSoC 2026.
- OSS Programs | ossium - Open Source Internships & Mentorships.
- Best Open Source Programs For Students to Participate - GeeksforGeeks.
- Major League Hacking (MLH) fellowship.

We need to list each with details: deadline, eligibility, online/location, cost, benefit, required skills, source link.

But we need to consolidate; many are similar open source programs. Pick the most relevant: GSSoC 2026, Google Summer of Code, MLH fellowship, ossium program.

Tools Worth Trying:

Items:

- API Developer Portals for Enterprise (Mintlify) with Fern.
- RapidAPI free public APIs.
- Box Dev Docs.
- Postman AI-native API Platform.

But "Tools Worth Trying" should be genuinely useful tools with concrete practical use case.

Potential items: Postman AI-native API platform, Fern for SDK generation, RapidAPI for testing APIs.

Tech Outside AI:

Items:

- Arm AGI CPU announcement (Mar 24, 2026) - Arm newsroom.
- Semiconductor packaging training in Taiwan (SEMICON Taiwan 2026) - The Elec.
- Which market will dominate semiconductor industry - LSE Business Review.
- Possibly Shield AI acquisition (but that's major companies category). But tech outside AI includes semiconductors, hardware, cloud, networking, major companies other material developments.

Shield AI is a major company but maybe falls under Major Companies category; but we have a separate "Major Companies" section in data, but required section is "Tech Outside AI". So we need to include semiconductor developments, maybe Arm AGI CPU, semiconductor packaging training, market dominance analysis.

Also maybe the "Arm AGI CPU" is relevant.

Now we need to produce the report.

First, "3 Things I Absolutely Should Know Today": three highest-impact developments across ALL categories. Must not invent; if only one or two truly important, say so.

We need to decide which three items are most impactful for a Diploma IT student in India.

Consider impact: cybersecurity advisory (CERT-In) is critical for Indian students because it warns about AI cyber threats and patch management; relevant to their daily work.

Google's Antigravity AI coding assistant could change how they code.

Maybe the ECMS approval for electronics manufacturing scheme affecting hardware development.

Or the Rs 1 lakh crore research scheme.

Or the Open Source programs opportunities.

But we need three items across categories; they could be from different categories.

Let's list potential high-impact items:

1. CERT-In urgent advisory on AI cyber threats in India (Cybersecurity category) - critical for security awareness.
2. Google's Antigravity AI coding assistant (AI category) - new tool that could affect development workflow.
3. ECMS approval and increased outlay (India policy) - supports electronics manufacturing, relevant for diploma students interested in hardware/embedded.

But we need to ensure each is indeed from data and we can cite source.

Alternatively, maybe the "Arm AGI CPU" is a major hardware development; but maybe less directly impactful for a diploma student compared to ECMS.

Let's examine the data for each.

AI items:

- Claude Code 2.1.266 fix (Sep 9, 2026). Might be less impactful than Antigravity.
- Antigravity is Google's next-generation AI coding assistant announced at I/O 2026, replacement for Gemini CLI. That seems significant.
- G2 data about AI coding assistants (June 3, 2026) maybe less.
- Analytics insight 7 AI coding features (maybe generic).
- ITbrew popular AI coding tools.

Thus the Antigravity announcement is likely the most impactful AI item.

Developer World items:

- Azure APIOps for automated API deployments.
- Octopus Deploy CD software.
- Postman AI-native API platform.

Which is most impactful for a diploma IT student? Possibly Postman's AI-native API platform, as they may work with APIs.

But we need to prioritize; maybe the Azure APIOps is significant for DevOps.

Cybersecurity:

- CERT-In advisory (May 6, 2026) about AI cyber threats, patch management, system logs. This is directly relevant for Indian students; impact critical.
- Also Chrome flaws (Mar 10, 2026) but maybe less broad.

Thus the CERT-In advisory is high impact.

India policy:

- ECMS approval (Mar 30, 2026) with increased outlay to Rs. 40,000 crore, backing electronics component manufacturing.
- Rs 1 lakh crore research and innovation scheme (Nov 12, 2025) establishing Atal Tinkering Labs.
- Space projects (Jun 12, 2026) maybe less.

The ECMS approval seems directly relevant to diploma IT students interested in hardware manufacturing, supply chain.

But we already have three items; maybe we pick the CERT-In advisory, Antigravity AI coder, and ECMS approval.

But we need to ensure each is from a different category? The rule doesn't forbid same category, but "3 Things I Absolutely Should Know Today" should be across all categories; they could be from same category but likely better to spread.

Now we need to format each item in the "3 Things" section? The structure says:

3 Things I Absolutely Should Know Today

The three highest-impact developments across ALL categories. Never invent items to fill this to three -- if there are only one or two truly important things, say so.

It doesn't specify the format for each item under that section; but likely we need to list them as bullet points with headline, what happened, why you should care, impact, maybe what to do, source.

However the later sections have specific format "**Headline** What happened: ... Why you should care: ... Impact: ... What to do: ... Source: ...". Does the "3 Things" section need same format? The instruction says "Write tonight's report in EXACT this structure:" then lists sections, but the format for each major item within a section is given after "FORMAT for each major item within a section:". That format likely applies to all sections that contain items, including "3 Things I Absolutely Should Know Today". However the "3 Things" section is listed first, and then the sections follow. The format description says "for each major item within a section:" So likely each item in each section should

follow that format.

Thus under "3 Things I Absolutely Should Know Today", we should list three items, each with **Headline**, What happened, Why you should care, Impact, What to do (only if justified), Source.

But the top level "3 Things" may just be three bullet points with those subfields. We'll need to decide.

Similarly, each section's items should follow that format.

Thus we need to produce items for AI, Developer World, Cybersecurity, India, Learn, Opportunities, Tools Worth Trying, Tech Outside AI.

But note: The "Learn" section should have items ranked Worth doing / Maybe / Skip. The format for each major item within a section includes "Why you should care: specific to a Diploma IT student in India." and "Impact: Low / Medium / High / Critical." and "What to do: only include this line when genuinely justified." and "Source: cite the source name from the data".

Thus for Learn section, we need to provide items (courses/resources) with headline, what happened (description), why you should care, impact, what to do (maybe "Enroll" or "Skip"), source.

But we have to be careful: The "Learn" section originally had YouTube videos and articles. We need to pick some and rank them.

Similarly, "Opportunities" section: list each opportunity with details: deadline, eligibility, online/location, cost, benefit, required skills, source link.

But the format described earlier (Headline, What happened, Why you should care, Impact, What to do, Source) may not include all those fields. However the "Opportunities" section description says: "For each: deadline, eligibility, online/location, cost, benefit, required skills, source link if available." So we need to include those fields, perhaps after the standard format, but the instructions say "FORMAT for each major item within a section:" then gives a format with Headline, What happened, Why you should care, Impact, What to do, Source. That seems generic; but for Opportunities we may need to adapt, but the rule says "Write each section header (## AI, ## Cybersecurity, etc.) EXACTLY ONCE, in the order given above. NEVER repeat a header a second time...". It doesn't say we cannot include extra fields beyond the format, but we must include at least the format lines. The "FORMAT for each major item within a section:" seems to apply to all sections. However the Opportunities section description says "For each: deadline, eligibility, online/location, cost, benefit, required skills, source link if available." That suggests we need to include those details, possibly after the standard lines, maybe as additional bullet points.

We need to decide how to reconcile. Probably we should include the standard format lines (Headline, What happened, Why you should care, Impact, What to do, Source) and then additionally include the opportunity specifics (deadline etc.) maybe after "Source:" or incorporate them into the "What happened" or "Why you should care". But the rule says "Do not pad sections to fill a quota." and "Write in plain, direct language. No filler, no hype words." So we need to be concise.

Probably we can include the opportunity details within the item, maybe after the standard lines, but we need to not violate the format rule. The format is given as an example; maybe we can extend it as needed, but must include those lines.

Given the complexity, maybe we simplify: For each opportunity, we provide a headline, brief description (what happened), why you should care (relevance to diploma IT student), impact (maybe High/Medium/Low), what to do (apply or not), source link, and then list deadline, eligibility, etc. as part of the item.

Similarly for Learn, we can rank each course as Worth doing/Maybe/Skip, and include why you should care, impact, what to do (e.g., "Enroll" or "Skip"), source.

Now, we need to consolidate duplicates and near-duplicates.

Let's parse each category and select the most relevant items.

AI:

We need to pick maybe one or two items. But the "3 Things" already includes an AI item (Antigravity). For the AI section, we need to list other significant AI developments beyond that. However we must not repeat the same item in both "3 Things" and the AI section? The rule says "If a story genuinely belongs to two categories, mention it in full under the single most relevant category only, and simply omit it from the other category's section entirely -- do not reference it there at all." So if we include Antigravity in "3 Things" and also in AI section, we need to choose one. Probably we include it in "3 Things" and omit from AI section, or include it in AI and not in "3 Things". But "3 Things" should be the three highest-impact across all categories; we could include Antigravity there, and then in AI section we can discuss other AI news (like Claude Code update, G2 data, etc.) but we must ensure not to repeat Antigravity.

Thus we need to decide which items go to "3 Things". Let's finalize the three:

1. CERT-In urgent advisory on AI cyber threats in India (Cybersecurity) - critical impact for Indian students.
2. Google's Antigravity AI coding assistant announced at I/O 2026 (AI) - new tool changing coding.
3. Government approves 29 more proposals under Electronics Component Manufacturing Scheme (ECMS) with increased outlay (India policy) - supports hardware manufacturing, relevant for diploma students.

These three span categories: Cybersecurity, AI, India policy.

Now, we need to ensure each is indeed from data and we can cite source.

- CERT-In advisory: source from data: "dqindia.com" or "Moneycontrol". The first entry: "[<https://www.dqindia.com/data-and-ai/cert-in-issues-urgent-warning-on-rising-ai-cyber-threats-in-india-11805127>] (Wed, 06 May 2026 00:00:00 GMT)] AI Cyberattacks in India: CERT-In Issues Urgent Advisory for MSMEs". We'll cite "dqindia.com" as source.
- Antigravity: source from "[<https://www.shakudo.io/blog/best-ai-coding-assistants>] Best AI Coding Assistants as of September 2026: Antigravity is Google's next-generation AI coding assistant..." We'll cite "Shakudo.io".

- ECMS approval: source from "[<https://www.pib.gov.in/PressReleasePage.aspx?PRID=2247040>] Government approves 29 more proposals under the Electronics Component Manufacturing Scheme (ECMS):". We'll cite "PIB".

Now, we need to write each of these as items under "3 Things" with the format.

But the "3 Things" section may just list three items; we need to include each with **Headline**, What happened, Why you should care, Impact, What to do (maybe "Stay informed", "Explore the tool", "Look into ECMS opportunities"), Source.

Now, we need to ensure we don't repeat the same item in other sections. For AI section, we can include other AI news besides Antigravity, e.g., Claude Code update, G2 data, but we must not include Antigravity. However we need to decide if there are enough other AI items to fill the section. The AI section should have at least one item; if we have none, we need to write one plain sentence saying so under that section's single header -- never a second header. But we likely have other AI items (Claude Code fix, G2 data, etc.). We'll include perhaps the Claude Code update as a minor item, but we need to consider impact. However we must prioritize high-value items; maybe we include only one AI item (the Claude Code fix) but that may be low impact. But the rule says "Prefer fewer high-value items over a large volume of news." So maybe we include just one AI item, but we need to ensure we don't pad.

But we have to follow the format; each item must have Impact line. We can include the Claude Code fix with Medium impact maybe.

But we must also consider that the "3 Things" already includes an AI item; we can still have other AI items in the AI section, but we must avoid duplication. The Claude Code fix is distinct from Antigravity, so okay.

Thus AI section will have one item: Claude Code 2.1.266 fix (or maybe the Antigravity is already used, so we pick Claude Code). However the Claude Code fix is about fixing a gateway regression; might be less impactful for a diploma student, but we can include it.

But we need to check if there are any other high-impact AI items: The G2 data maybe not. The Antigravity is already used. So we include Claude Code.

Now Developer World section: we need items. We have several: Azure APIOps, Octopus Deploy, Postman AI-native API platform, GitHub devops tools list, etc. We should pick the most impactful for a diploma IT student. Perhaps Postman AI-native API platform, as it's directly relevant to API development. Or Azure APIOps for automated API deployments. Let's choose Postman AI-native API platform, as it's a tool they might use.

But we must ensure we don't double-count Postman with "Tools Worth Trying" maybe. The "Tools Worth Trying" section could include Postman as a tool. But the rule says if a story belongs to two categories, mention it in full under the single most relevant category only, and omit from the other. So we need to decide which section Postman belongs to. Postman is an API platform, could be under Developer World (developer tools) or Tools Worth Trying (useful tools). The "Tools Worth Trying" section is for genuinely useful tools with concrete practical use case. Postman fits there. So we might place Postman in Tools Worth Trying, and Developer World could have other items like Azure APIOps or Octopus Deploy.

Thus Developer World section might have Azure APIOps or Octopus Deploy.

Let's decide: Developer World will have Azure Architecture Center: Automate API Deployments by Using APIOps. That's a relevant development practice.

We'll include that item.

Cybersecurity section: we have CERT-In advisory already used in "3 Things". But the Cybersecurity section must have its own items; we cannot omit it entirely. The rule: "If a section genuinely has nothing significant, write one plain sentence saying so under that section's single header -- never a second header." But we have CERT-In Chrome flaws and maybe other items. However the CERT-In advisory is already used in "3 Things". Can we also include it in Cybersecurity section? The rule about duplication: "If a story genuinely belongs to two categories, mention it in full under the single most relevant category only, and simply omit it from the other category's section entirely -- do not reference it there at all." The CERT-In advisory is about AI cyber threats; it could be considered both Cybersecurity and India (policy). But the "India" section also may cover policy. The rule says if a story belongs to two categories, mention it in the single most relevant category only. We need to decide which category is most relevant. The advisory is about cybersecurity in India, so likely Cybersecurity. So we should not include it in India section. Thus Cybersecurity section should have other items, maybe the Chrome flaws advisory. But we need to check if there are other cybersecurity items.

We have three CERT-In items: AI cyber threats warning, advisory against AI-driven cyber attacks, Chrome flaws. We could pick the Chrome flaws as a separate item, but it's also about security flaws. However the Chrome flaw is specific to Google Chrome; might be less broadly impactful than the AI cyber threats advisory. But we need at least one item in Cybersecurity section. We could include the Chrome flaws advisory.

But we must be careful: The Chrome flaw advisory is from CERT-In, dated Mar 10, 2026. That's a security advisory; impact medium maybe.

Thus Cybersecurity section will have that item.

India section: we have policy items: ECMS approval, Rs 1 lakh crore research scheme, space projects. We already used ECMS approval in "3 Things". So we cannot include ECMS again. We need other India items. The Rs 1 lakh crore research scheme could be included. The space projects maybe less relevant. So India section will have the Rs 1 lakh crore research and innovation scheme.

But we need to ensure we don't double-count: The "3 Things" included ECMS approval; India section will have the Rs 1 lakh crore scheme.

Thus India section item: PM launches Rs 1 Lakh Crore Research, Development and Innovation Scheme.

Now Learn section: we need to pick some learning resources and rank them. We have YouTube videos: "I tried 50 Programming Courses. Here are Top 5.", "Computer Science Lessons", "C Programming Tutorial for Beginners", "Learn These 5 FREE AI Courses Before It's Too Late!", "Saumya Singh" video about new certification courses from Microsoft, Google & TCS 2026, "How I mastered C in College: Complete Roadmap + Free Courses + Book PDF!".

We need to rank each as Worth doing / Maybe / Skip, with reasoning specific to a Diploma IT student. We should pick maybe 3-4 items, not too many. Let's select:

- CS50 (mentioned in the "I tried 50 Programming Courses" video) - likely Worth doing for fundamentals.
- The "Learn These 5 FREE AI Courses Before It's Too Late!" video - maybe Maybe, as AI courses may be hype but still useful.
- The "C Programming Tutorial for Beginners" - maybe Worth doing for core C skills.
- The "How I mastered C in College" roadmap - maybe Skip if too specific.

But we need to provide impact and what to do.

We need to cite sources: The videos are from YouTube, but we need source name; we can cite "YouTube" as source, but need to specify video title maybe.

But the format expects source name from data (e.g., "TechCrunch"). The data includes YouTube links; we can cite the channel or video title. We'll cite "YouTube" as source, but might need to be more specific.

Given the complexity, maybe we limit Learn section to one or two items.

But the rule: "If a section genuinely has nothing significant, write one plain sentence saying so under that section's single header -- never a second header." We have significant learning items, so we should include some.

We need to pick perhaps two items: CS50 course (Worth doing) and the free AI courses video (Maybe). We'll include them.

Now Opportunities section: we have several open source programs: Google Summer of Code, GitHub new programs, GSSoC 2026, OSS programs, MLH fellowship, etc. We need to list each with details: deadline, eligibility, online/location, cost, benefit, required skills, source link.

But we need to consolidate; many are similar. We'll pick the most relevant for a Diploma IT student in India: GSSoC 2026 (GirlScript Summer of Code 2026), Google Summer of Code (GSOC), MLH fellowship, and maybe OSS programs.

But we need to provide details; we have some data.

Let's examine the opportunities data:

- "[https://stavanshah.framer.website/blog_Info/blog-02] Top Paid Open Source Programs for Aspiring Tech Professionals■■■■ - March | 2024: Google Summer of Code, a 17-year-old effort from Google, promotes open-source software creation among university students. The initiative involves organizations with mentors that apply to Google and, if chosen, approve student applications. It's worth noting that participants aren't Google employees or interns; instead, they work with their selected company. This paid program in India runs from Fe..." (text cut off). This is about GSoC, but date March 2024, maybe outdated.
- "[<https://www.opensourceforu.com/2021/03/github-announces-three-new-programs-for-developer-s-students-and-startups-in-india>] GitHub Announces Three New Programs For Developers,

Students And Startups In India: News ... ### OpenTrailPaper Turns LILYGO Hardware Into a Bike Computer ..." This mentions GitHub programs for developers, students, startups in India. Might include specifics.

- "[<https://gssoc.girlscript.org/open-source-india>] Open Source in India 2026: Complete Student Guide - GSSoC 2026: GSSoC (GirlScript Summer of Code) 2026 is the best free open source program for beginners in India. It is completely free, accepts all skill levels, provides a dedicated mentor, has beginner-friendly issues on all accepted projects, and runs for 3 months from May to August. 50,000+ participants joined in recent editions." This is current 2026.
- "[<https://ossium.in/home/oss-programs>] OSS Programs | ossium - Open Source Internships & Mentorships: Winter open source program by Jalpaiguri Government Engineering College (JWoC) aimed at introducing students to open source development. India ~1-2 months No stipend (certificates provided) December-January Open Mainframe Project Mentorship banner ..."
- "[<https://www.geeksforgeeks.org/blogs/best-open-source-programs-for-students-to-participate>] Best Open Source Programs For Students to Participate - GeeksforGeeks: You're working with that organization that you applied to or got selected in. It is a paid program with a stipend of 1500 USD for Medium Size Projects and 3000 USD for Large Size Projects in India. ... Major League Hacking (MLH), founded in 2013, is a global community for student developers. MLH recently launched a program known as MLH fellowship which is a 12-week remote program where students ..."
- Possibly also the "Top Paid Open Source Programs" but outdated.

We need to pick a few opportunities with clear details.

Let's select:

1. GSSoC 2026: deadline? Not specified in data, but we can note runs May to August, free, all skill levels, mentor, beginner-friendly issues. Eligibility: beginners in India. Benefit: experience, certificate maybe. Required skills: basic programming. Source: GSSoC 2026 guide.
2. GitHub three new programs for developers, students and startups in India: we need details; the data mentions "GitHub Announces Three New Programs For Developers, Students And Startups In India" but no specifics. Might be vague; we could include but hedge.
3. MLH fellowship: 12-week remote program; maybe eligibility: student developers; benefit: experience, network. Source: Major League Hacking.

But we need to provide deadline, eligibility, online/location, cost, benefit, required skills. For some we may not have data; we can omit or note "data not specified". But rule says "Do not treat a single unverified item as confirmed fact -- hedge appropriately if the data only gives one weak source." So we should be cautious.

Thus we might include only GSSoC 2026 with known details, and maybe MLH fellowship with known structure (12-week remote). For others, we can mention but note limited info.

But we need to include each opportunity as an item with the format, but also include the specific fields.

Given the difficulty, maybe we include two opportunities: GSSoC 2026 and MLH fellowship, with the details we have.

Now Tools Worth Trying: we have items like Postman AI-native API platform, Fern for SDK generation, RapidAPI free public APIs, Box Dev Docs. We need to pick genuinely useful tools with concrete practical use case.

Let's pick:

- Postman AI-native API platform: helps develop, test, manage APIs; practical use case for diploma students working on API projects.
- Fern: generates SDKs and API docs from same definition; useful for multi-language projects.
- RapidAPI free public APIs: provides ready-to-use APIs for testing and integration.

We can include these three.

But we must avoid duplication with Developer World; Postman could be in Tools Worth Trying, not Developer World. Azure APIOps in Developer World.

Now Tech Outside AI: we have Arm AGI CPU announcement, semiconductor packaging training, market dominance analysis. We need to pick maybe the Arm AGI CPU announcement as a significant hardware development.

Also maybe the SEMICON Taiwan training, but maybe less impactful.

Thus Tech Outside AI section will have Arm AGI CPU announcement.

Now we need to ensure we have all sections as per required order:

1. ## 3 Things I Absolutely Should Know Today
2. ## AI
3. ## Developer World
4. ## Cybersecurity
5. ## India
6. ## Learn
7. ## Opportunities
8. ## Tools Worth Trying
9. ## Tech Outside AI
10. ## My Action for Tomorrow
11. ## If You Only Remember 3 Things

We must not repeat any header; each appears once.

Now we need to write each section's items.

Let's start drafting.

3 Things I Absolutely Should Know Today

We need three items, each with **Headline**, What happened, Why you should care, Impact, What to do (if justified), Source.

Item 1: CERT-In urgent advisory on AI cyber threats in India.

Headline: "CERT-In issues urgent advisory on AI-powered cyber threats in India"

What happened: On May 6, 2026, CERT-In issued an urgent warning about rising AI-assisted cybercrime, emphasizing intensive patch management, elimination of known vulnerabilities, and maintaining detailed system logs for MSMEs, organisations, and individuals.

Why you should care: As a Diploma IT student in India, you will likely work with systems that must comply with government advisories; understanding these risks helps you implement basic security hygiene and avoid exploitation in projects or internships.

Impact: Critical

What to do: Review the advisory, ensure your personal/projects systems are patched, and adopt habit of maintaining logs.

Source: dqindia.com

Item 2: Google's Antigravity AI coding assistant announced at I/O 2026.

Headline: "Google announces Antigravity, a next-generation AI coding assistant"

What happened: At Google I/O May 2026
